Skin Whitening Ingredient β-Arbutin

 β -Arbutin is often referred to as Arbutin. It can be extracted from bearberry or synthesized by chemical method. It is a green, safe and effective skin whitening ingredient.

Basic Information

INCI Name: Arbutin **Application:** Skin whitening cosmetics **Appearance:** White crystalline powder **CAS No.:** 497-76-7 **Chemical Formula:** C₁₂H₁₆O₇ Molecular Weight: 272.25 **Recommended Dosage**: 2%~7% **Specification:** 25kg/drum

Storage and Expire date : Keep sealed in a shaded and cool place between 5 and 25 degree. If strictly following the storage instruction, it can be stored well for 2 years.

β-Arbutin Specification

Item	Company Standard	QB/T4953-2016 Industry Standard
Assay %	≥ 99.5	≥ 99.5
Hydroquinone ppm	≤10	≤ 20
Appearance	White crystalline	White crystalline
Melting point °C	199.0~201 ± 0.5	199.0-201.0
Specific rotation	(a) ²⁰ _D = -66° ± 2°	-64°~-66°
Clarity of water solution	Transparent, colorless, none suspended matters	
Infrared peak value	1515 cm ⁻¹ 1220 cm ⁻¹ 1050 cm ⁻¹ ± (5~8) cm ⁻¹	
Chloride %	≤ 0.036	
Arsenic ppm	≤ 2	≤ 10
pH (1% aqueous)	5.0-7.0	5.0-7.0
Loss on drying %	≤ 0.5	≤ 0.5
Heavy metal ppm	≤ 10	≤ 40
Ignition residue %	≤ 0.5	

Luckerkong company standard is higher than industry standard. Blank items are not regulated by industry standard.

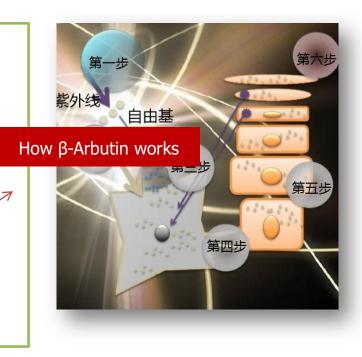

Six steps for skin whitening

- 1、Prevention: Do not expose to the UV directly.
- 2、Protection: Anti-free radical and inflammation.
- 3、 Melanin's activation: reduce Melanin cell generation and action.
- 4. Melanin 's generation: inhibit the enzymes activity that promotes the melanin generation.
- 5、 Existing Melanin: reduce existing Melanin and spots.
- 6、Others: Promote skin metabolism, and accelerate the melanin's decomposition.

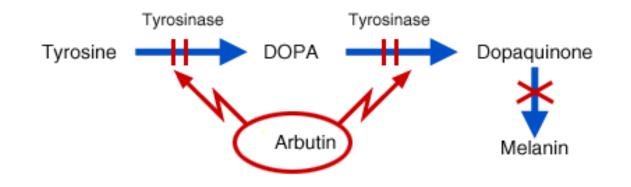

β-Arbutin Working Mechanism

Hyperpigmentation in the epidermis is caused by excessive melanin synthesis due to UV irradiation, wound or stress. Tyrosinase is one of the key enzymes involved in melanin synthesis. The enzyme catalyses the first two steps in melanin synthesis: the hydroxylation of tyrosine to DOPA and the oxidation of DOPA to dopaquinone. Arbutin has an direct inhibitory function against tyrosinase, which leads to the prevention of melanin formation and a whitening effect on the skin. Arbutin can reduce the accumulation of pigment by inhibiting the production of melanin, which accumulates on the skin when tyrosine is oxidized.

β-Arbutin Working Mechanism

Application of β-Arbutin in Cosmetics

Arbutin is an active skin whitening ingredient extracted from bearberry, it is green, safe, reliable and effective. It is also one of the most competitive skin whitening ingredient which is very popular abroad now.

鲸蜡硬脂基葡糖苷	1		乳化剂 保湿剂

Experimental Data

Batch No. : HC20180914A

Data shows that Arbutin with dosage over 7% may result in photosensitivity.

Therefore, Arbutin with dosage over 7% is not recommended in application.

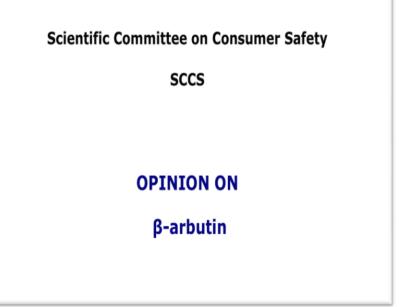

The active ingredient of Arbutin can go through the basal layer of the skin and have effective effect on reducing chloasma, specks, erythema and pigments caused by allergy.

However, Arbutin with low dosage may damage the durability of its effect. Therefore, Arbutin with 5% dosage is the safest and most effective. Arbutin with 5% dosage will not irritate the skin and it is more effective and stable than Vitamin C in reducing dark spots and pigments.

Scientific Committee on Consumer Safety (SCCS) Opinion on Beta-Arbutin

"The SCCS considers the use of β-arbutin to be safe for consumers in cosmetic products in a concentration up to 7% <i>in face creams provided that the contamination of hydroquinone in the cosmetic formulations remain below 1 ppm."

Product Strength of Luckerkong β-Arbutin

- 1. High purity and quality, no
 - hydroquinone remained.
- 2. More safer and reliable without
 - organic solvent.
- 3. GMPc manufacturing line offers best stability.
